Analyzing AirBnB NYC for A Data-driven Investment

By Marbella Elpantja

End-to-End Data Analytics Project in Microsoft Excel (Upper Intermediate Level)

Phase 1 — Data Cleaning & Preparation

Phase 2 — Data Analysis & Financial Calc.

Phase 3 — Data Visualization & Conclusion

Completed as part of the *Excel Expert Exam Preparation Course by Maven Analytics*, simulating a real investment decision through market evaluation, financial modeling, and data storytelling utilizing Microsoft Excel functions, formulas, and other features.

Project Overview

Following the dataset and guideline from ***Excel Expert Preparation course by Maven Analytics taken in Udemy***, I analyzed a dataset involving 6,000 Airbnb listings, where advanced Microsoft Excel concepts to determine the investment potential of one property in NYC. I used Excel functions and formulas to conduct customer behavior assessment, potential profit prediction, and property competitiveness evaluation in order to generate insights that lead to an informed investment decision

6,000+

AirBnB Listings

5

NYC Boroughs

4000+

Registered Hosts

Following **3 phases of the data analytics**: data cleaning, data analysis, and data visualization

Phase 1

Data Cleaning & Preparation

Logical formulas with nested logic, aggregate and lookup functions, date and number formatting, conditional formatting, and error checking.

Phase 2

Data Analysis & Financial Modelling

PivotTables a with calculated fields, slicers, grouping, and creating a dynamic mortgage calculator to model ROI based on different scenarios

Phase 3

Data Visualization & Conclusion

Advanced charts (combo, funnel, map) and investment verdict based on consideration of market patterns and financial modeling.

Copyright @MarbellaElpantja 2026

The Workbook Structure

8 interconnected worksheets built from 6,000+ raw Airbnb listings

Places

6,000 listing records with 29 fields: price, service fees, tax, rating, rating class, room type, availability, superhost status, number of reviews, etc

Hosts

4,149 unique host profiles from 26 countries, linked to the Places sheet via Host ID, and display cohort-level analysis for AirBnB hosts over time

Neighborhoods

31 neighborhoods counted and categorized across 5 districts, and serves as the lookup source for cross-sheet formulas into Places table

Mortgage Calculator

A dynamic, fully interactive financial model for evaluating the investment property where mortgage values can recalculate based on users' inputs

2019 Occupation

12-month day-by-day grid covering 2019, wheere each cell shows red color for booked (1) or green color for available (0) mapped to Mon–Sun columns

Amortization Schedule

Monthly and yearly breakdown of payment based on specific loan details, showing payment amount, running principal, running interest, and balance

Pivot

Specific analysis of multiple pivot tables consisting of price and ratings comparison, neighborhood level deep-dives, and host cohort analysis

Visualizations

6+ chart types and their insights: Waterfall P&L, Funnel of Conversion Journey, Box & Whisker, Treemap, Sunburst, Combo Map, Geographic Map

Copyright @ MarbellaElpantja 2026

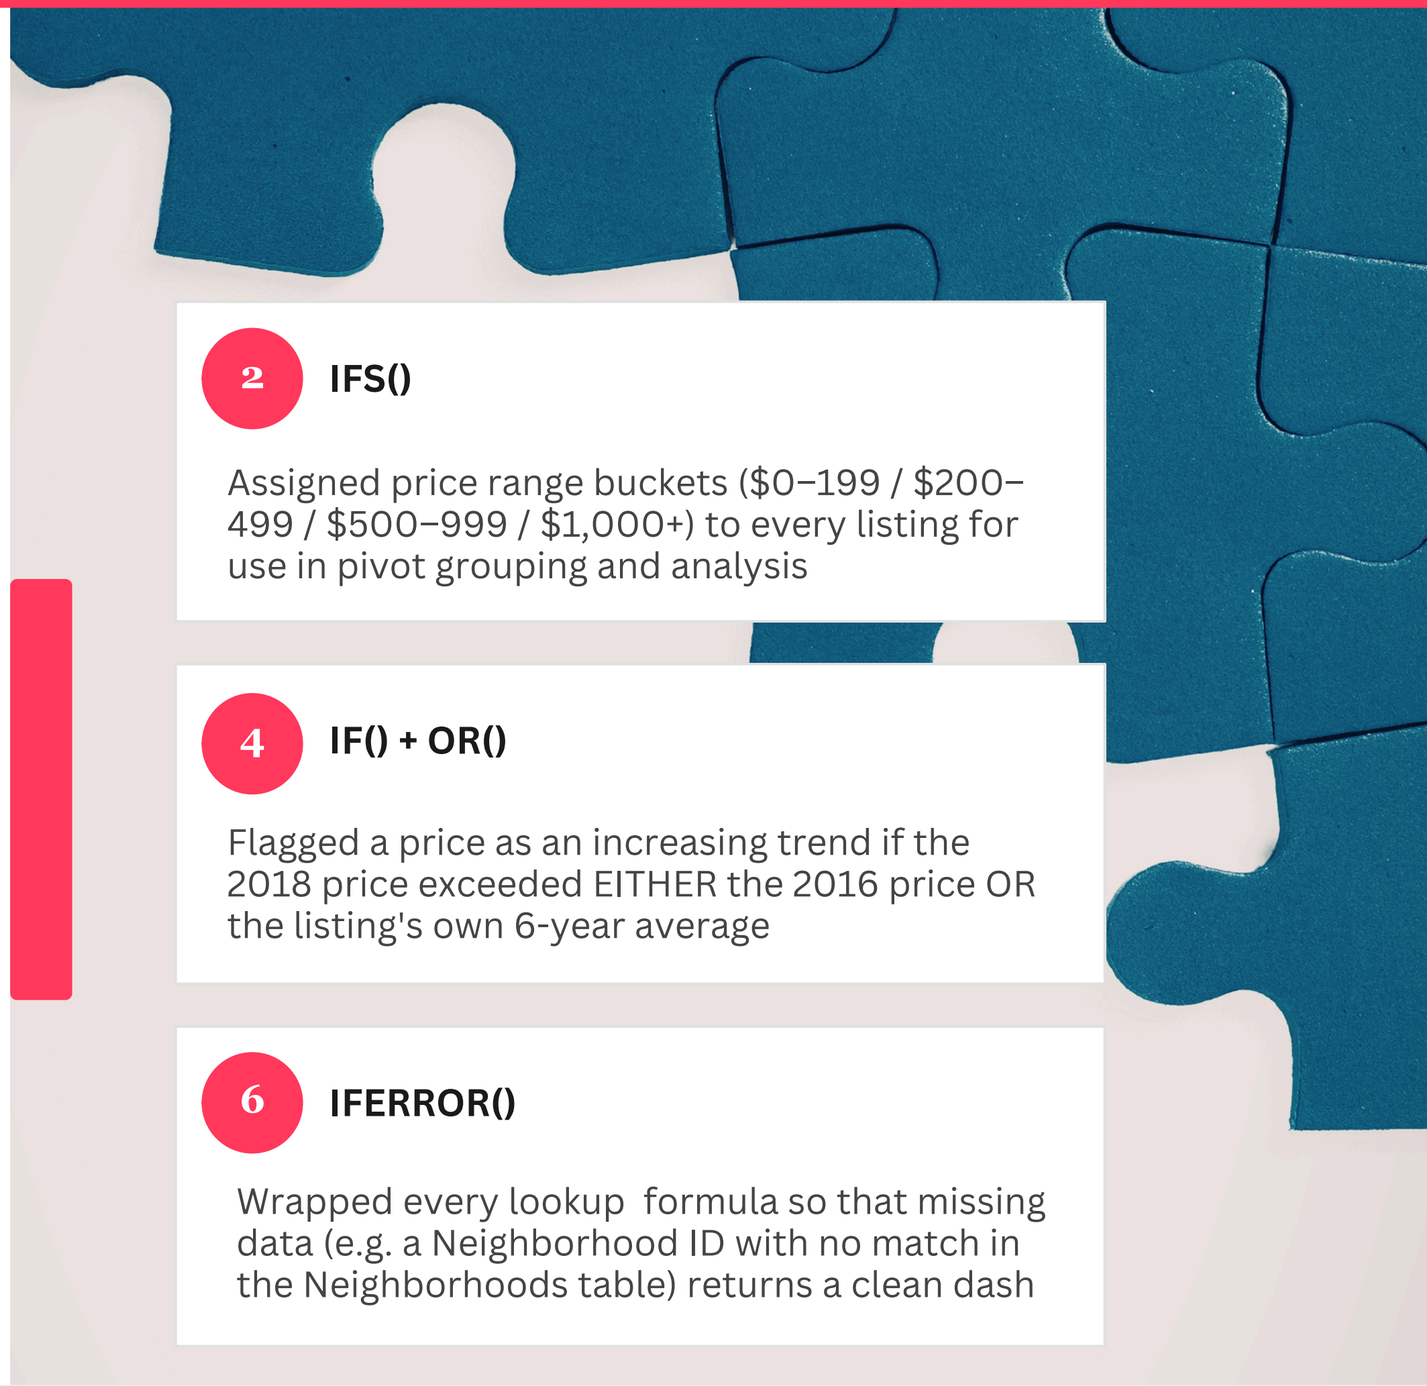

Phase 1

Data Cleaning & Preparation

Logical formulas · Lookup functions · Date Formatting · Conditional formatting · Aggregation

Logical Functions

NESTED IF · IFS · OR / AND · SWITCH · IFERROR

1 NESTED IF

Determined whether a house's price is considered increasing, the same, or decreasing; but using three decision layers in sequence

2 IFS()

Assigned price range buckets ($0–199 / $200–499 / $500–999 / $1,000+) to every listing for use in pivot grouping and analysis

3 IF() + AND()

Flagged a price as an Increaseif the 2018 price exceeded EITHER the 2016 price OR the listing's own 6-year average

4 IF() + OR()

Flagged a price as an increasing trend if the 2018 price exceeded EITHER the 2016 price OR the listing's own 6-year average

5 SWITCH()

Grouped each listing into a Rating Class by matching the Rating field against defined thresholds, in a more efficient way than IFS()

6 IFERROR()

Wrapped every lookup formula so that missing data (e.g. a Neighborhood ID with no match in the Neighborhoods table) returns a clean dash

Copyright @ MarbellaElpantja 2026

Lookup Functions

VLOOKUP · INDEX MATCH

1 VLOOKUP — Host & Neighborhood Mapping

Pull host details (response time, acceptance rate, rating) from the Hosts sheet into Places sheet based on the Host ID column and certain index

```
VLOOKUP([@[Host ID]], Hosts!A:A: A:P, 3, 0)
→ Find the Host ID in column A of the Hosts
table, return whatever is in column 3 (Host Name)
```

2 INDEX MATCH — 2D Lookup

Pulling neighborhood data from the Neighborhoods sheet into the Places sheet by matching both the row (which neighborhood) AND the column (which field to return)

```
=INDEX(Neighborhoods!$A$2:$C$32,
MATCH(Places!$H24, Neighborhoods!$A:$A, 0),
MATCH(Places!I$1, Neighborhoods!$1:$1, 0))
```

VLOOKUP vs INDEX MATCH

- VLOOKUP: most cases where lookup column is leftmost and column index needed would not change
- INDEX MATCH: any lookup to the left of value being matched, or where column index position is not fixed
- Both wrapped in IFERROR to prevent #N/A from propagating into charts and pivot tables

Therefore VLOOKUP is 1D and INDEX MATCH is 2D

Copyright @ MarbellaElpantja 2026

Formatting and Aggregate Functions

DATE()· YEAR() · MONTH() · SUMIFS() · COUNTIFS() · AVERAGEIFS()

Date Parsing

- DATE() reconstructed the first 2 digits of raw integers entered as dates into proper Excel date values
- YEAR() and MONTH() extracted year and month components for high-level time-based grouping
- WEEKDAY(date, 2) returned 1 (Mon)–7 (Sun) using ISO standard for the calendar grid

Aggregate Functions

- COUNTIFS: counted listings matching multiple conditions (e.g. active + entire place + Manhattan)
- AVERAGEIFS: calculated average price per category of location and type of room for comparison tables
- SUMIFS(): totaled revenue projections by category of previous performance and host availability

```
=DATE(LEFT([@[Date Joined]],4), MID([@[Date Joined]],5,2), RIGHT([@[Date Joined]],2))
```

```
=YEAR([@[Formatted Date Joined]])
=MONTH([@[Formatted Date Joined]])
```

```
=SUMIFS(Places[Price], Places[Status], "Active", Places[Room Type], "Entire place")
```

```
=COUNTIFS(Places[District], "Manhattan", Places[Superhost], "Yes", Places[Status], “Active")
```

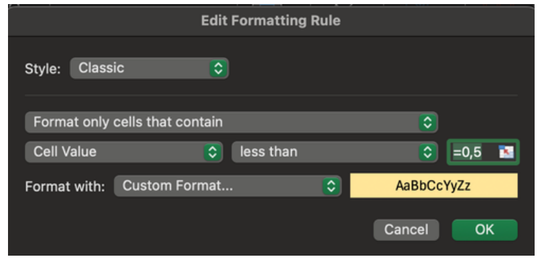

Copyright @ MarbellaElpantja 2026

Conditional Formatting

Three-rule conditional formatting system

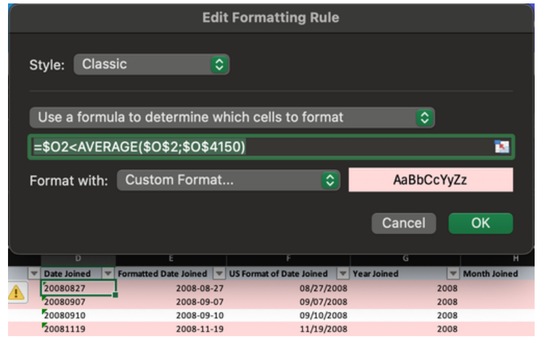

CF Rule 1 — Cell Value Rule Formatting

Highlighted acceptance rate cells where value < 0.5 with yellow fill in order to instantly flag hosts with a booking acceptance rate that is less than 50% of the time.

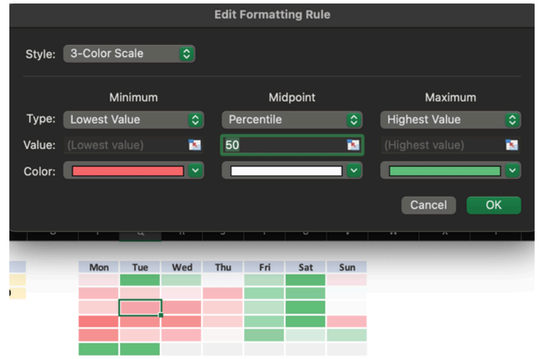

CF Rule 2 — Color Scale Range Formatting

Maps the average occupancy for a specific day of the week between 0 and 1, where 0 (never booked) renders fully green and 1 (always booked) renders fully red, with values in between producing a gradient. The average occupancy takes into account all occurrences for that day of the week throughout 2019

CF Rule 3 - Formula-based Row Formatting

Highlights entire row in pink when a host's acceptance rate falls below the dataset average, with mixed reference applied so that each row evaluate its own acceptance rate. The rule is applied to the full Hosts table range so the pink fill spreads across all 16 columns of that host's row and not just the column

Copyright @ MarbellaElpantja 2026

Phase 2

Data Analysis & Financial Calculation

PivotTables · Financial Model · Slicers and Filters · Custom grouping · Calculated Field

Financial Modeling - Part 1

PMT and NPER Formula

Calculated the standard monthly mortgage payment for the target investment property based on a 30-year term at 5% annual interest.

Fixed Term Scenario

```
=PMT(5%/12, 30*12, -319200)
```

PMT Formula

Calculates how long the loan for purchasing the target property takes to pay off based on a fixed monthly paymentof $1,500.

Fixed Payment Scenario

```
=NPER(5%/12, -1500, 319200)
```

NPER Formula

FIXED TERM	
Term Length (yrs)	30
Monthly Payment	$1.371

FIXED PAYMENTS	
Term Length (yrs)	24,76
Monthly Payment	$1.500

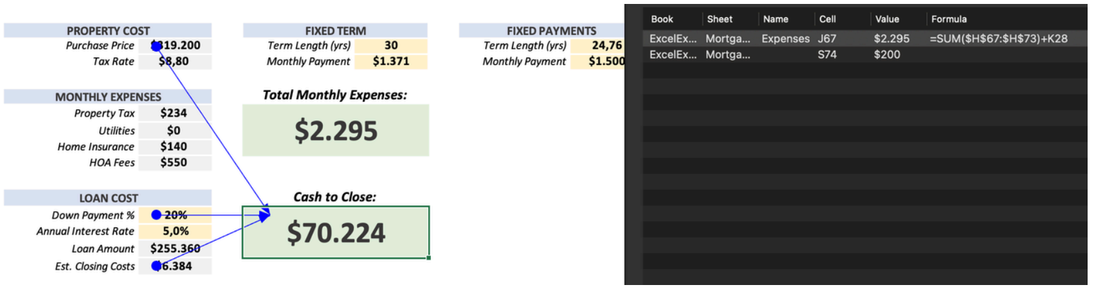

FIXED TERM	
Term Length (yrs)	30
Monthly Payment	$1.371

FIXED PAYMENTS	
Term Length (yrs)	24,76
Monthly Payment	$1.500

Additional Notes

The Watch Window was used to pin Total Monthly Expenses and Price per Night so their values stayed visible while editing inputs on a different part of the sheet

Trace Dependents and **Trace Precedents** are activated to ensure that key cells in the Mortgage Calculator (e.g. Cash to Close) are wired to appropriate input cells (e.g. purchase price, interest rate).

Copyright @ MarbellaElpantja 2026

Financial Modeling - Part 2

Amortization Schedule · Mortgage Calculator

Mortgage Calculator — Dynamic Input Model

Builds a dynamic dashboard that suits the user's preferred scenario since purchase price, down payment, loan amount, annual interest rate, and term are all live input cells, allowing users to type in any values and have the entire model recalculate instantly, producing an updated PMT monthly payment, property tax, estimated closing costs, and cash to close, without any modification to formula.

Amortization Schedule — 30 Yrs for $319.200 Loan

Each of the 360 monthly rows breaks the fixed payment into its principal and interest components, where interest equals the remaining balance multiplied by rate. Over 30 years period, as the balance shrinks each month, slightly less goes to interest and slightly more goes to principal. Running SUM columns track cumulative principal paid, cumulative interest paid, and remaining balance of loan that needs to be paid off.

MONTHLY EXPENSES	
Property Tax	$234
Utilities	$0
Home Insurance	$140
HOA Fees	$550

LOAN COST	
Down Payment %	20%
Annual Interest Rate	5,0%
Loan Amount	$255.360
Est. Closing Costs	$6.384

Total Monthly Expenses:

$2.295

Cash to Close:

$70.224

Mortgage Information	
Start Date:	2020-09-01
Loan Amount:	$319.200
Down Payment:	20%
Interest Rate:	5,0%
Term Length:	30

Year	Principal	Interest	Balance
2020	$1.544	$5.310	$317.656
2021	$4.788	$15.774	$312.868
2022	$5.033	$15.529	$307.835
2023	$5.291	$15.272	$302.544
2024	$5.562	$15.001	$296.982

Pivot Table — Part 1

Two pivot tables analyzing property competitiveness againts overall listings and those in Chelsea

1 PivotTable_AllDistrict — Borough Comparison

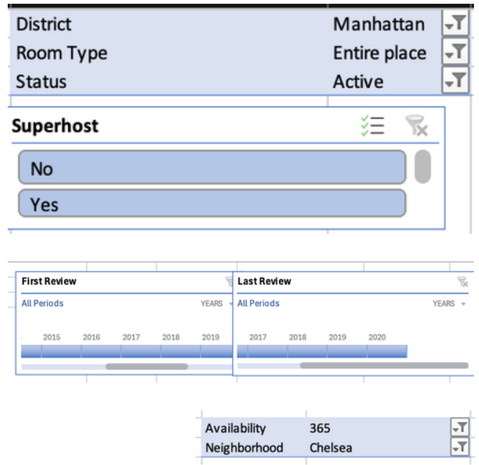

Analyze how listing count, average price, and average rating are distributed across all five NYC boroughs, with a % of Total column added to show relative market share

Manhattan has the highest avg price at $165/night, roughly 2× Staten Island's $84, and the largest listing count, with Manhattan and Brooklyn accounting for over 75% of all active NYC listings

District	Average Price	Average Rating
Bronx	**$90**	**4,76**
Allerton	$117	4,78
Concourse	$88	4,75
Longwood	$98	4,81
Mott Haven	$87	4,85
Port Morris	$65	4,60
Brooklyn	**$113**	**4,80**
Bedford-Stuyves	$118	4,79
Bushwick	$92	4,80
Crown Heights	$132	4,80
East Flatbush	$85	4,76
Greenpoint	$135	4,87
Wakefield	$125	4,88
Manhattan	**$166**	**4,79**
Chelsea	$190	4,80
East Harlem	$112	4,75
East Village	$207	4,81
Harlem	$138	4,81
Hell's Kitchen	$191	4,71
Midtown	$233	4,77
Upper East Side	$188	4,79
Upper West Side	$85	4,67
Williamsburg	$142	4,84
Queens	**$136**	**4,80**
Astoria	$93	4,85
Flushing	$87	4,76
Jamaica	$81	4,76
Long Island City	$125	4,85
Ridgewood	$100	4,79
Upper West Side	$225	4,80
Staten Island	**$84**	**4,82**
Arrochar	$101	4,86
St. George	$104	4,91
Stapleton	$101	4,87
Sunnyside	$77	4,80
Tompkinsville	$80	4,85

Filters and Slicers

Search for specific Room Type, Status and Availability, Superhost (Yes/No), District, Neighborhood, and Period

2 PivotTable_Manhattan — District Deep Dive

Identify how Chelsea's listings compares against similar ones across neighborhoods in Manhattan, with small-sized, one-bedroom, entire-place as the main constraints

Chelsea shows an average price of $160 for Small entire-place listings, approximately 6.7% above the overall Manhattan Small average of $150, and it also boasts the highest average rating of 4.86 in Manhattan

Size	Neighborhood	Accommodates	Num of Places	Average of Price	% Difference from Chelsea	Average of Rating
+ Small						
	+ Chelsea		35	$160		1
	+ East Village		54	$160	53,61%	3
	+ Williamsburg		109	$147	185,42%	2
Total Places & Average Price for Small			198	$153		
+ Medium						
	+ Chelsea		42	$251		2
	+ Williamsburg		164	$181	182,25%	1
	+ Harlem		130	$164	102,72%	3
Total Places & Average Price for Medium			336	$183		
+ Large						
	+ Upper East Side		16	$777	160,01%	2
	+ East Village		24	$388	94,57%	3
	+ Chelsea		13	$368		1
Total Places & Average Price for Large			53	$500		
Grand Total			587	$202		

Copyright @ MarbellaElpantja 2026

Pivot Table — Part 2

Two pivot tables analyzing price and host performance, focusing in Chelsea neighborhood

3 PivotTable_Chelsea — Price Trends Analysis

Using custom grouping to create $100 buckets for prices in Chelsea neighborhood, filtered to entire-place active listings only to match the target property's segment exactly

67.81% of all Chelsea listings are priced below $200. The $200–$300 range accounts for only 16.44% of listings and everything above $300 represents less than 16%

Room Type	(All)
District	(All)
Neighborhood	Chelsea

Price Category	Num of Places	% of Total Place
0-100	37	25,34%
100-200	62	42,47%
200-300	24	16,44%
300-400	13	8,90%
400-500	4	2,74%
500-600	2	1,37%
600-700	1	0,68%
700-800	1	0,68%
800-900	2	1,37%
Grand Total	**146**	**100,00%**

4 PivotTable_FirstReview — Host Trend Analysis

Analyze the growth arc of hosts joining the platform and the proportion achieving Superhost status evolved between 2008 and 2020, assesing market maturity and competition

While host registration peaked between 2012 and 2016, and then declined, superhost percentage stayed consistently above 40%, confirming that it is still an achieveable benchmark

District	(All)
Neighborhood	Chelsea

First Review Category	% of Total Place	Average Rating
2010	0,68%	4,99
2011	0,68%	4,99
2012	2,05%	4,93
2013	5,48%	4,90
2014	8,22%	4,81
2015	5,48%	4,89
2016	13,70%	4,84
2017	13,01%	4,78
2018	7,53%	4,85
2019	28,77%	4,68
2020	14,38%	4,87
Grand Total	**100,00%**	**4,80**

Additional Notes

Calculated Field: Divides the nightly listing price by the number of guests it accommodates, to ensure listings are comparable on equal footing

Show Values As → % of Grand Total: Reframes listing counts into proportional shares of the overall market.
Show Values As → % Difference From: Expresses every other Manhattan neighborhood's average price as a percentage above or below Chelsea's average

Copyright @ MarbellaElpantja 2026

Phase 3

Data Visualization & Conclusion

Box & Whisker · Treemap · Sunburst · Combo · Map · Histogram · Investment Decision

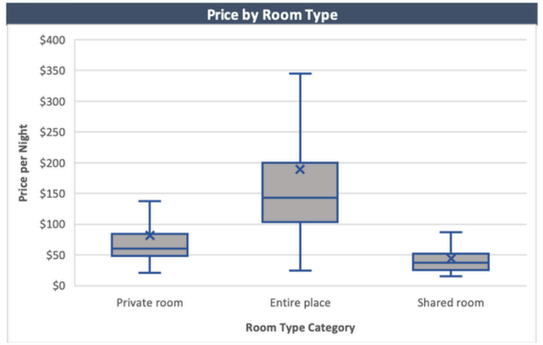

Data Visualizations — Charts 1-3

Three chart types chosen to visualize

1 Box & Whisker
Price Distribution by Type

Visualize how far apart prices are spread across Private room, Entire place, and Shared room listings

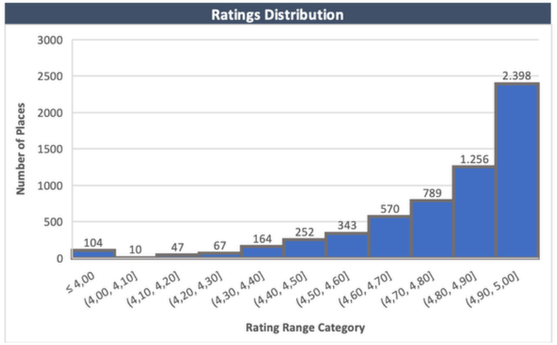

Entire place has the widest spread of three categories, ranging from $30 at the low end to $10,000 at the extreme high end, with a median at $150. Half of entire-place listings price below $150 and half price above, but a few luxury dramatically stretch the upper whisker.

2 Histogram
Ratings Distribution

Visualize how guest ratings are distributed across all 6,000 listings in 0.1 increments from 4.00 to 5.00

The vast majority of listings cluster at the high end, with the 4.9–5.0 bucket is the largest bar with 2,398 listings, followed by 4.8–4.9 with 1,256 listings, meaning over half of all 6,000 listings rate above 4.8. Anything below 4.6 is severely disadvantaged in this competitive market.

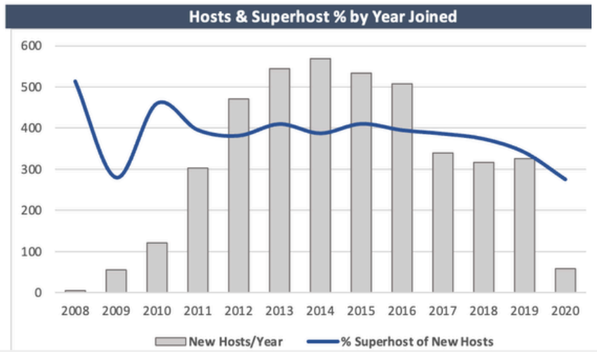

3 Combo Chart
New Hosts vs % Superhost

Tracks the volume of new hosts each year and the proportion achieving Superhost status from 2008 to 2020

Host registrations grew steadily from 2008 and peaked sharply between 2012 and 2016 as the platform gained mainstream traction, while Superhost percentage held consistently at 40–50% throughout the entire growth period. Both metrics heavily contracted in 2020 due to COVID19.

Year Joined	Hosts	Superhost %
2008	5	60%
2009	55	33%
2010	121	54%
2011	303	46%
2012	471	45%
2013	545	48%
2014	568	45%
2015	534	48%
2016	507	46%
2017	339	45%
2018	316	44%
2019	326	40%
2020	59	32%

Copyright @ MarbellaElpantja 2026

Data Visualizations — Charts 4-6

Three chart types chosen to visualize geographical distributions of listings and hosts origin

4 Sunburst Chart
Borough → Neighborhood

Showing how each neighborhood contributes to its parent borough, creating a hierarchical structure

Manhattan contains neighborhoods like Chelsea, Hell's Kitchen, Harlem, East Harlem, Upper West Side, and others, all displayed as equal-width slices within their parent borough arc.

5 Treemap Chart
Listing Counts by Location

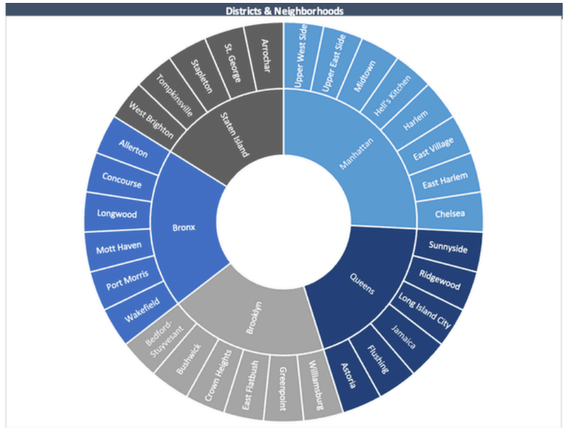

Visualize the relative concentration of listings across all five NYC boroughs and neighborhoods

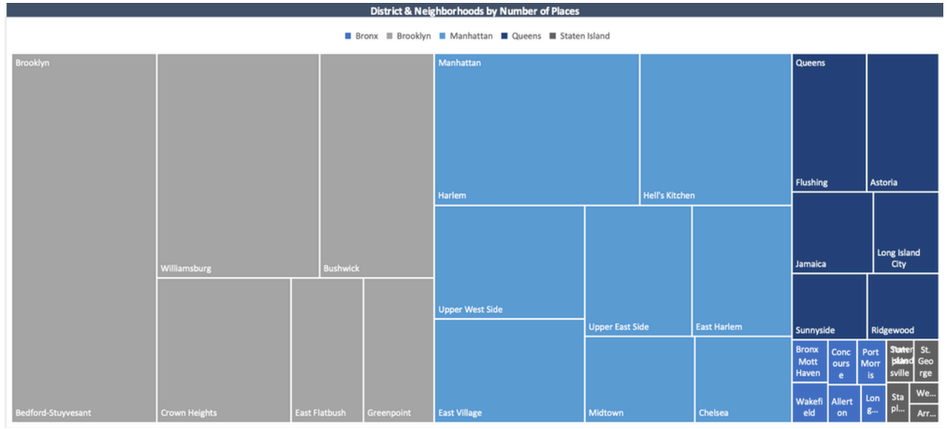

Chelsea's properties sit visibly small within the large Manhattan block, representing 146 total listings and only 90 active entire-place listings, yet it is inside a borough that accounts for 38% of all NYC Airbnb

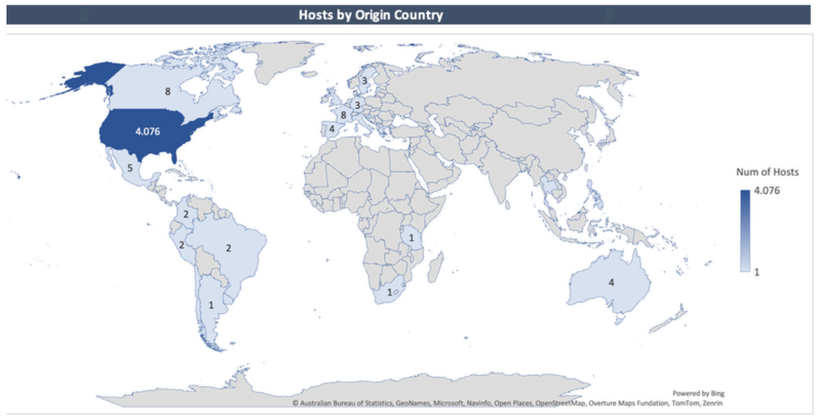

6 Geographical Map Chart
Hosts by Origin Country

Reveal whether the market is driven by domestic hosts, international ones, or consists of both distributed evenly

98% of all NYC Airbnb hosts are US-based, meaning the competitive landscape is almost entirely domestic, and observed host behaviors and pricing strategies are based on US context alone

Copyright @ MarbellaElpantja 2026

Investment Target > Broader Market

These are the main takeaways regarding how the item is positioned within NYC AirBnB market

Target property at Chelsea sits at the border between dominant and premium pricing

$200/night the target property sits exactly at the upper boundary of Chelsea's dominant $100–$200 price tier — where 42.47% of all Chelsea listings are concentrated — and at the entry point of the $200–$300 premium tier which holds only 16.44% of listings

Target's neighborhood, Chelsea, is a small but strategically positioned slice of a dominant borough

Chelsea's 146 total listings represent only 6.3% of Manhattan's 2,313 listings — and Manhattan itself accounts for 38.6% of all 6,000 NYC listings. That combination means Chelsea offers low supply concentration inside the highest-demand borough in the city

91% of listings rated Excellent — quality is the minimum standard

Average rating is 4.80, with only 104 listings fall below 4. Anything below 4.5 is at a structural disadvantage in search ranking and conversion. Our investment target, rated at 4.89, sits in the second-highest rating bucket, but not yet in the elite 4.9–5.0 group

45% of hosts are Superhosts — an achievable competitive edge

Superhost is not rare — nearly half of all hosts qualify. The combo chart showed Superhost % stayed consistently above 40% even as host count grew or plateau. It boosts visibility and conversion rate, but also not achieving this means our property is at a disadgvantage

CONCLUSION

At $200/night the target property sits above Q3 of the entire-place distribution, placing it in the top 25% of the entire-place market, confirming a premium positioning strategy that is ambitious but not an extreme outlier. Considering the competitive landscape yet relatively limited supply of Small entire-place listings, this confirms the $200 price point is still defensible

Copyright @ MarbellaElpantja 2026

Calculating The Future Return on Capital

Calculating the **Return Of Invesment** (ROI) and comparing it to the annual interest rate in order to determine investment decision requires prior calculations on property amortization, monthly expenses, and predicted occupancy rate

Property Details

Location	**Chelsea, Manhattan**
Room type	**Entire place · Small**
Bedrooms / Bath	**1 BR / 1 BA**
Size / Price per Square	**450 sq ft · $886/sq ft**
Property tax	**$243 / month**
Purchase Price	**$319,200 · 20% as Down Payment**
Annual interest rate	**5.0%**

Investment Details

Average Occupancy	**~15 nights / month**
Potential List Price	**$200 / night**
Potential Term Length	**30 years**
Total Loan Amount	**$255,360**
Monthly Payment Needed	**$1,371 / month**
Fixed Monhly Expenses	**$2,295 / month**
Potential Loan Period	**2020 - 2050**

Copyright @ MarbellaElpantja 2026

ROI Calculation > Investment Verdict

Step 1 - Monthly Income and Expenses

Gross Monthly Income : Price per night × Avg occupied nights per month

: $200 × 15.63 = **$3,126/month**

Monthly Fixed Costs : Mortgage payment + Tax + Home insurance + HOA + Utilities

: $1,371 + $234 + $140 + $550 + $0 = **$2,295/month**

Step 2 - Monthly and Annual Profit

Monthly Net Income : Gross Monthly Income - Monthly Expenses

: $3,126 – $2,295 = $706/month

Annual Net Income. : Montly Profit * 12 Months / year

: $706 × 12 = **$8,472/year**

Step 3 - ROI againts Cash to Close

Return on Investment : Annual net income ÷ Cash to close

: $8,472 ÷ $70,224 = **~12%**

Since mortgage payment is already accounted in the annual net income, the **cash spent on day one** is used as **capital at risk** in ROI calculation

PROPERTY COST	
Purchase Price	$319.200
Tax Rate	$8,80

FIXED TERM	
Term Length (yrs)	30
Monthly Payment	$1.371

MONTHLY EXPENSES	
Property Tax	$234
Utilities	$0
Home Insurance	$140
HOA Fees	$550

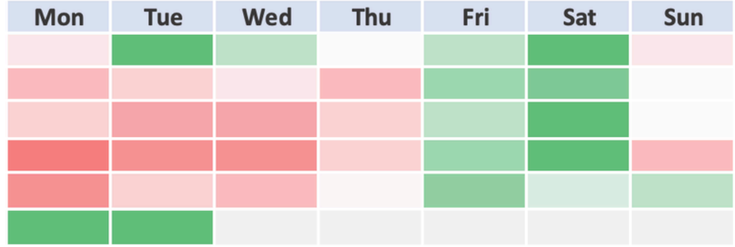

Total Monthly Expenses:

$2.295

LOAN COST	
Down Payment %	20%
Annual Interest Rate	5,0%
Loan Amount	$255.360
Est. Closing Costs	$6.384

Cash to Close:

$70.224

Avg. Nights per Month:	15,629
Price per Night:	$200
Profit per Night:	$192

Total profit:

$ 706

Since the ROI of 12% exceeds the minimum threshold of 5% (annnual interest rate), the investment is considered viable

Copyright @ MarbellaElpantja 2026

More Excel Concepts Covered (1)

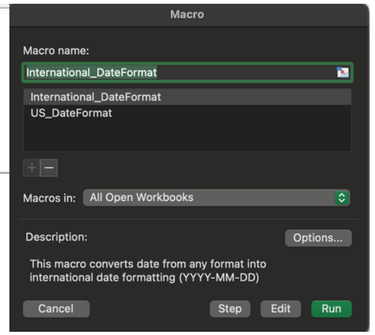

Demonstrated Excel features to **increase automation for data preparation**

Macro

Replay button that instantly apply a sequence of Excel actions, saved and accessed via the Visual Basic for Applications interface.

> Automate two types of date conversion: one to international format (yyyy-mm-dd) and one to US format (mm/dd/yyyy).

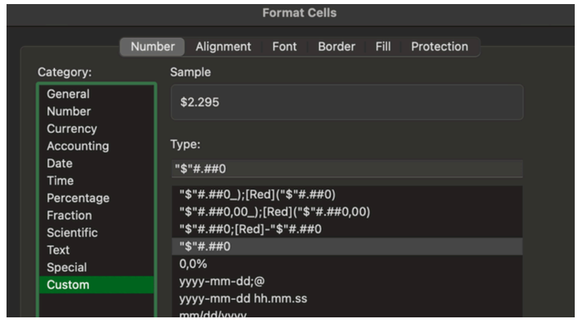

```
Sub US_DateFormat()
'
' US_DateFormat Macro
' This macro converts date from any formatting into US-standard formatting (mm/dd/yyyy)
'
' Keyboard Shortcut: Ctrl+Shift+U
'
    Selection.NumberFormat = "mm/dd/yyyy"
End Sub
Sub International_DateFormat()
'
' International_DateFormat Macro
' This macro converts date from any format into international date formatting (YYYY-MM-DD)"&chr(13)&"
'
' Keyboard Shortcut: Ctrl+Shift+I
'
    Selection.NumberFormat = "yyyy-mm-dd;@"
End Sub
```

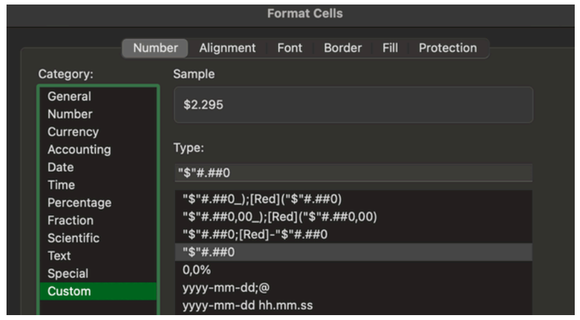

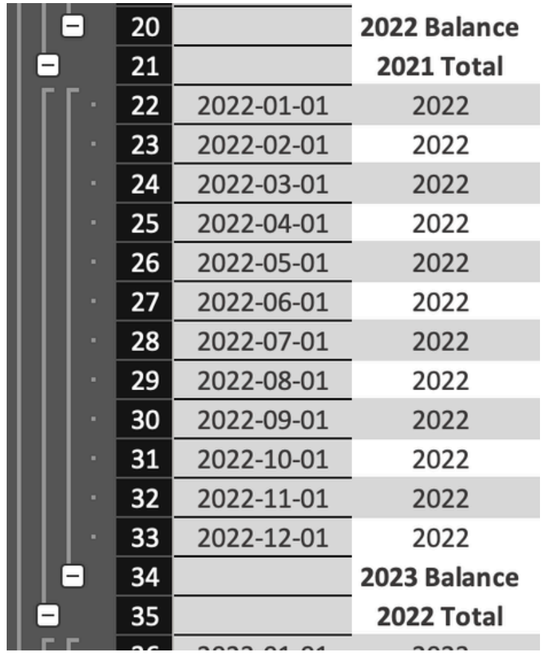

Subtotal

Inserts summary rows at each change in a specified grouping column, creating a collapsible outline mimicking SUM formula approach.

> Applied to Amortization Schedule table, grouped by the Year column, showing that year's total principal paid and total interest paid.

20		2022 Balance
21		2021 Total
22	2022-01-01	2022
23	2022-02-01	2022
24	2022-03-01	2022
25	2022-04-01	2022

31	2022-10-01	2022
32	2022-11-01	2022
33	2022-12-01	2022
34		2023 Balance
35		2022 Total

Number Formatting

Controls how a value is displayed, including what to show for currency symbols, decimal places, color, positive, negative, zero, and text.

> $#,##0 — displays price values as currency with comma separator plus no decimals so 319200 displays as $319,200.

Copyright @ MarbellaElpantja 2026

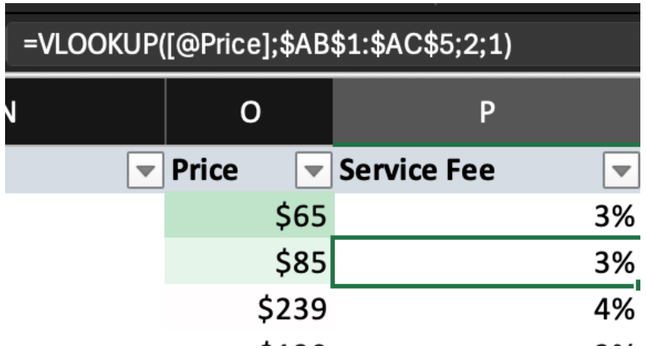

More Excel Concepts Covered (2)

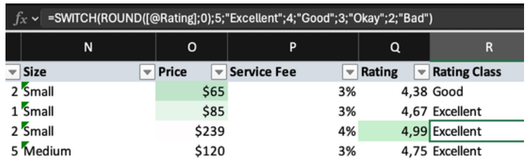

Demonstrated Excel features to **support accuracy in data analysis**

VLOOKUP — Approximate Match (1)

Approximate match treats the threshold values as range boundaries, not exact targets, assuming the threshold table is sorted low to high

> Uses a sorted threshold table to find which bracket a price belongs to in order to find th3 appropriate service fee rate

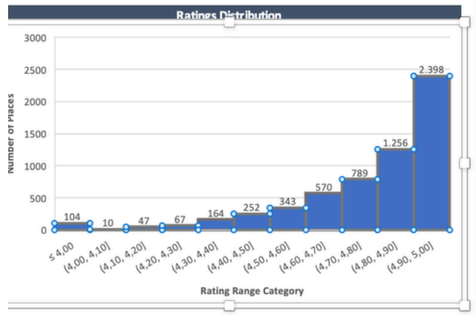

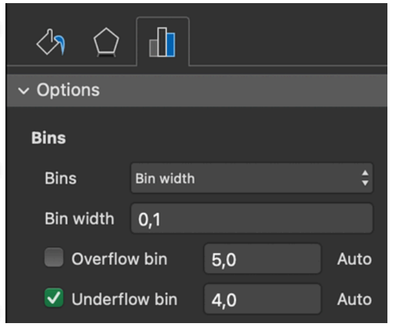

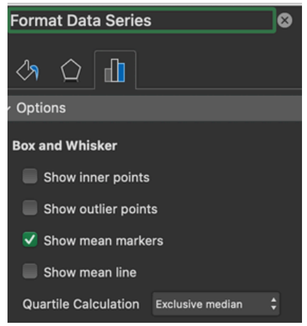

Outlier Data Handling for Charts

Outliers are data points that fall so far from the main distribution that they distort visuals, so they need to handled based on the chart type

> For histogram → Format Axis → check Underflow bin → set value to 4.0. so all ratings below 4.0 collapses into one single bar at the most left

PivotTable Show Values As — Rank Largest to Smallest

Assigns a rank number to each row based on its value in a specified field — 1 for the highest, 2 for the second highest, and so on

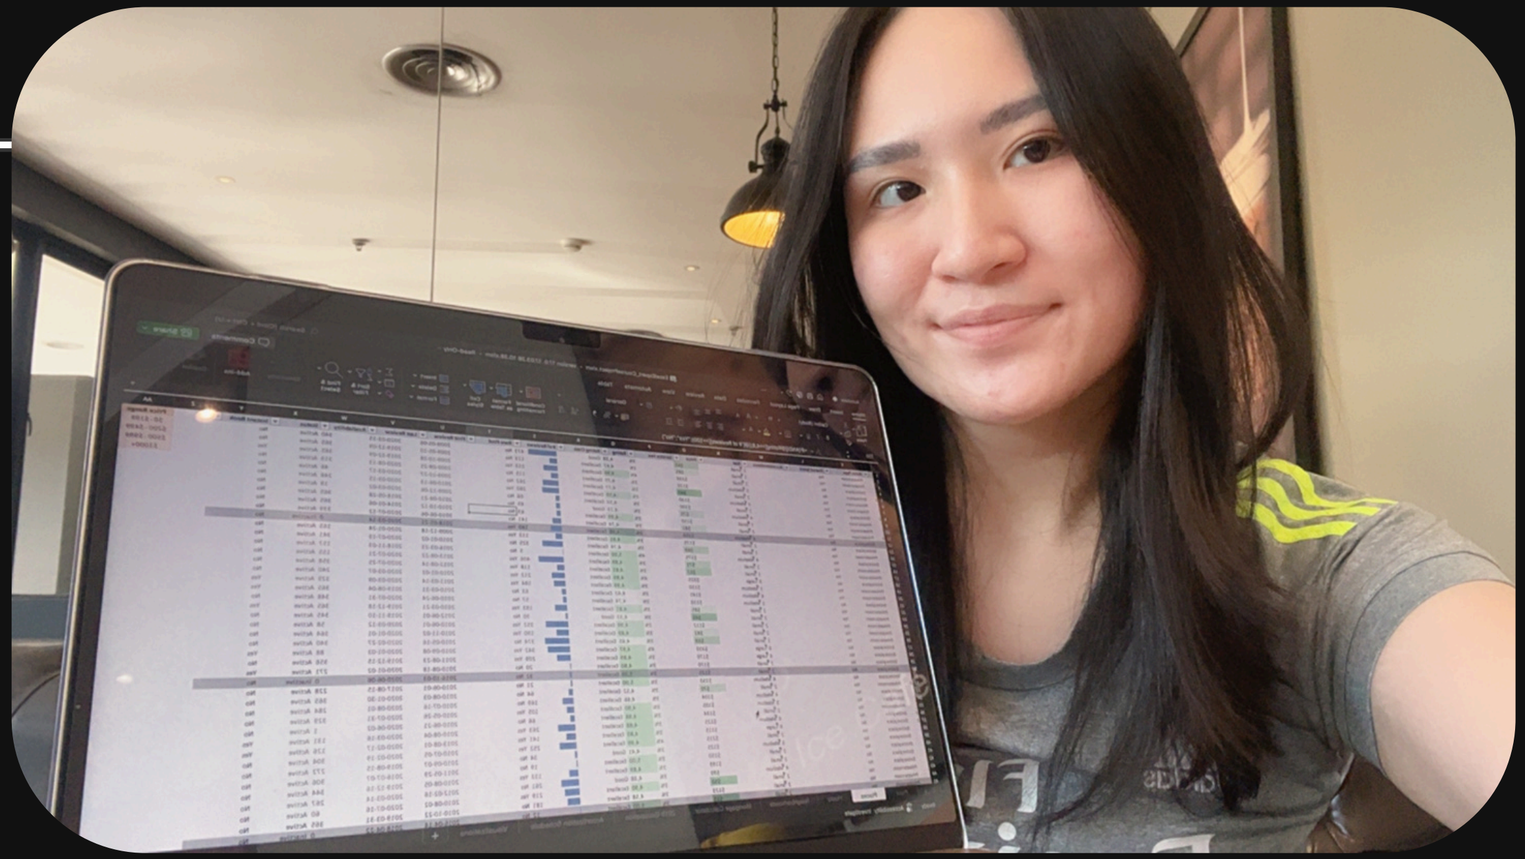

> Applied to the Average Rating field of pivot table so Manhattan neighborhoods are ranked from the highest to lowest rated

Neighborhood in Manhattan	Num of Active, Entire Places in Neighborhood	% of Active, Entire Places Accommodation in Manhattan	Average Price for Active, Entire Places Accommodation	% Difference from Chelsea's Active, Entire Place Accommodation	Average of Rating for Active, Entire Places	Rank of Rating among Manhattan Active, Entire Places
Chelsea	90	6,58%	$232		4,86	2
East Harlem	97	7,09%	$159	-26,12%	4,75	7
East Village	147	10,75%	$210	47,57%	4,79	4
Harlem	235	17,18%	$215	141,10%	4,81	3
Hell's Kitchen	195	14,25%	$222	106,97%	4,76	6
Midtown	104	7,60%	$274	36,02%	4,72	8
Upper East Side	171	12,50%	$225	83,66%	4,78	5
Williamsburg	329	24,05%	$186	193,21%	4,87	1
